Agenda

1. What is Azure DevOps?
2. Alternatives
3. Disposable vs Durable code
4. A PowerShell build pipeline
5. Demo

What is Azure DevOps?

- Cloud-based (or on-premise) tool for planning, coding, testing and deploying software.
- Use whichever features you need
  - Can be used for the entire SDLC
  - Can be integrated with other tools platforms (e.g GitHub).
- Free
  - Public projects are being retired 😟
  - Private projects have less concurrent jobs / build minutes

Alternatives

- GitHub Actions
- Azure DevOps self-hosted agent
- GitLab CI/CD
- CircleCI
- Bitbucket Pipelines
- AppVeyor

Disposable vs Durable code

- Disposable:
  - Short-lived
  - Rapid prototyping
  - Inexpensive
  - Dangerous if it becomes production

- Durable:
  - Long-term
  - High-stakes
  - Expensive
  - Prone to over-engineering

More important than ever

"AI has *not* eliminated the need for fast feedback loops and software guardrails—it's made them more important than ever."

— https://www.honeycomb.io/blog/disposable-code-is-here-to-stay, Charity Majors 2025

A PowerShell build pipeline

- Repeatable, automatic steps that should run every time there is a change
  - Combine the module into a single PSM1
  - Run PSScriptAnalyzer
  - Run Pester unit tests (Windows PowerShell / Core, MacOS, Linux)
  - Publish Documentation
  - Deploy to PS Gallery (and/or other artifact repo)

Demo

Implementing an Azure DevOps build pipeline for a new PowerShell module.
